

SOLUTION BRIEF:

Fixed Wireless Access from Stratix and AT&T

Every location needs a connection. Not everyone has a good one.

Every business location you operate depends on the internet. That includes established branches and stores, new sites waiting on fiber, rural and remote facilities, job sites and pop-ups, and service teams on the move. It also includes the alarm, elevator, and fire panel lines still running on aging copper. Each one needs a connection that’s live on day one and stays up when it matters.

Wired service doesn’t always keep pace. Fiber can take months to reach a new site, and some locations will never get it at all. As carriers retire copper, legacy phone lines and safety systems are on a deadline. Sites that rely on a single wired connection have a single point of failure, and teams without a fixed address have nothing to wire in the first place.

Fixed Wireless Access (FWA) gives each of those locations a fast, flexible path to business-grade internet, whether as a primary connection, a backup, a bridge, or a replacement. Stratix and AT&T help you put it to work at one site or hundreds.

What is Fixed Wireless Access?

FWA delivers business internet over a cellular network (5G and 4G LTE) instead of a cable in the ground. A router or gateway at your site connects to nearby cell towers, which are themselves connected by fiber. Your devices and applications run through it just as they would on a wired line. You may also hear it called wireless broadband or wireless internet.

How businesses use FWA

AT&T offers three Fixed Wireless Access solutions. Stratix helps you choose the right one for each site and handles what it takes to get it running.

Use case	AT&T solution	How Stratix helps
Primary internet: Locations where wired service is unavailable, slow, or too costly.	AT&T Internet Air® for Business	Solution matching, router sourcing, configuration, and deployment at every site.
Bridge or temporary connectivity: New store openings, pop-ups, and events, often while waiting on fiber.	AT&T Internet Air® for Business, which can shift to a secondary connection once fiber arrives	Staging and kitting so devices arrive ready well ahead of opening day.

Use case	AT&T solution	How Stratix helps
Backup and failover: A second, physically separate connection that keeps critical applications running when the primary line fails.	AT&T Business Wireless Backup (Advanced or Pooled data plans) or AT&T Internet Air® for Business	Matching each site to the right plan for its data needs, then rolling it out across locations.
Copper and legacy line replacement: Sites moving off aging copper, including alarm, elevator, and fire panel lines.	AT&T Internet Air® for Business with AT&T POTS Replacement Service, or AT&T Wireless Broadband with a third-party POTS replacement solution	Coordinating connectivity and replacement equipment across every affected site.
Mobile operations: Field teams, job sites, and organizations without a fixed or permanent address.	AT&T Wireless Broadband	Device support and replacement as teams and sites move.

Why FWA makes sense now

- **Faster deployment.** Get a site online without trenching or waiting on a wired install.
- **Simpler resilience.** Add a diverse path without building and paying for a second wired connection.
- **Built to scale and budget.** Standardize connectivity across branches, franchises, and multi-site operations. Avoid the build-out fees that come with extending wired service to a site, and keep a predictable monthly expense.

Why Stratix and AT&T

- **AT&T brings the network.** Stratix brings everything it takes to put that network to work at every location you manage.
- **Consulting on the right mix.** Stratix works alongside AT&T to match each location to the right solution, whether that's primary, backup, or mobile.
- **One partner from network to device.** Instead of coordinating a carrier, a hardware vendor, and a deployment partner, you work with one team that covers all three.
- **The right hardware for every site.** We source FWA routers and gateways from a broad range of manufacturers. We match the device to the location, not the other way around.
- **Deployment at scale.** Stratix configures, stages, kits, and ships devices so they arrive ready to install, whether you're connecting one site or hundreds.
- **Fewer platforms to manage.** Expanding FWA across more locations? Stratix helps you standardize devices and management, so your team isn't juggling multiple consoles.
- **Support for the full lifecycle.** Help desk, repair and replacement, and device refresh keep every site running long after go-live.

Ready to get connected?

Whether you're opening new locations, replacing aging lines, or adding a backup you can count on, Stratix and AT&T can help. Contact your Stratix representative to get started.
